ABSTRACT

Coccidiosis is a major parasitoses and redoubtable in the cunicoles breeding , for that we conducted a prevelance survey in the region of medea in order to contribute the identification of the coccidies species

This work focused at the begining on the enumeration of coccidies of *Eimeria* genus by quantitive technique of Mac Master .and subsequently we established an identification of *Eimeria* species by the technique of flourishing

The obtained results show that the level of contamination is below the threshold of health risk,as well as the species most frequently encountred in stockbredeers is *Eimeria Media* with a frequency rate 29.7%.

Keywords : Coccidiosis , rabbit, numeration, Médéa.
